

INDUPLAST will recycle plastic material from electrical and electronic devices out of use

- **A mechanical treatment will be employed in order to sort different plastic types, without generating emissions or waste.**
- **It will be installed in the industrial polygon El Longar (Zalla) and it is foreseen to be operational by the first trimester of 2023.**

Induplast facilities will be dedicated to the treatment of plastics that are recovered from electrical and electronic equipment out of use to incorporate them back into the production cycle. The plant will be located in the polygon El Longar, in the municipality of Zalla, and its implementation will generate ten new job positions.

The waste that Induplast will treat, exclusively plastic, is a non-dangerous waste, and is, therefore, catalogued that way by all the competent administrations in the matter. This is a fundamental aspect of the project, which is reinforced by the fact that the activity does not produce emissions or landfills. The treatment consists on the application of mechanical processes for the separation of the plastic materials contained in WEEE, in order to extract and classify the different types of plastic for its proper reincorporation into the production cycle among different industrial sectors.

With a global investment of 8 million euros and a treatment capacity of 15,000 tons of plastic waste per year, the construction of the plant will begin this year and it is expected to be operational by 2023.

Induplast's project is part of the general objective of the Indumetal Recycling companies' group to promote the circularity of materials as a key strategic factor in the objectives of sustainable development in all social and economic environments on the planet.

At the moment, Induplast's project has the required authorizations for its development. Specifically, it has the municipal license, as well as the authorization from the Basque Water Agency (URA) that is necessary to install the activity in the polygon due to the potential risks of flooding in the area. The commissioning of the plant will also require the unified environmental authorization granted by the Basque Government, intended for non-hazardous waste treatment activities.
